ABSTRACT

Introduction One of the most conflicting methodological issues when conducting an overview is the overlap of primary studies across systematic reviews (SRs). Overlap in the pooled effect estimates across SRs may lead to overly precise effect estimates in the overview. SRs that focus on exercise-related interventions are often included in overviews aimed at grouping and determining the effectiveness of various interventions for managing specific health conditions. The aim of this systematic

STRENGTHS AND LIMITATIONS OF THIS STUDY

- ⇒ This methodological review will use a systematic approach to describe the strategies used to manage the overlap of primary studies in exercise-related overviews.
- ⇒ This review will conduct a sensitive search of MEDLINE (Ovid), Embase (Ovid), The Cochrane Database of Systematic Reviews (Cochrane Library), Epistemonikos databases and registers of evidence

Materiales y Métodos

Diseño del estudio

- Análisis secundario de un estudio de meta-investigación (meta-research study).

Análisis

- Se incluyó overviews de intervenciones relacionadas con el ejercicio en que los autores realizaron MMA.
- Análisis descriptivo.
- Cálculo de CCA.
- Realización de MMA ajustados por solapamiento.
- JASP software.

Columns

	Review 1	Review 2	Review 3	...
Primary publication 1	x			
Primary publication 2	x		x	
Primary publication 3	x	x	x	
Primary publication 4		x		
Primary publication 5		x	x	
...				

Primary publication 2 is included in review 1 and review 3, but not in review 2

$$CA \text{ (covered area)} = \frac{N}{rc}$$

$$CCA \text{ (Corrected CA)} = \frac{N-r}{rc-r}$$

where N is the number of included publications (including double counting) in evidence synthesis (this is the sum of the ticked boxes in the citation matrix); where r is the number of rows (number of index publications) and c is the number of columns (number of reviews).

Table 1. Interpretation of CCA

CCA	Overlap
0–5	Slight
6–10	Moderate
11–15	High
>15	Very high

Abbreviation: CCA, corrected covered area.

Conclusión

- El solapamiento de estudios primarios puede afectar la precisión del efecto calculado mediante la estrategia de meta-meta-análisis, pudiendo incluso provocar que una intervención sea estadísticamente significativa cuando en realidad no lo es.
- ¿Los MMA son una estrategia adecuada para resumir/agrupar los resultados de las RS incluidas en una overview?
- ¿Existen algunos casos especiales en donde la realización de MMA podría ser una estrategia eficiente?
- ¿Podría ser el grado de solapamiento un indicador útil para evaluar la validez de realizar MMA?
